

How to use the dashboard.

A plain-English guide for anyone — no marketing background needed. It shows you what this screen is, how to move around it, and what every word means. If you've never seen a dashboard like this, start here.

What is this?

It's one screen that shows how HDI's marketing and sales are doing — visitors to the website, posts on LinkedIn, blog articles, and the sales pipeline — all in one place, updated automatically from HDI's real systems. **You don't enter anything.** You just open it and read. Think of it like the dashboard in a car: a set of dials that tell you, at a glance, how things are running.

1 • GETTING YOUR BEARINGS — THE PARTS OF THE SCREEN

Everything you control lives at the top.

Here's a simplified picture of the top of the dashboard. The four numbered dots point to the only parts you ever need to touch.

1 The tabs

Six buttons. Click one to switch views. The five that matter: Board, Insights, Website, Blog, LinkedIn.

2 The time window

Click **7D / 30D / 90D / All**, or pick your own **From–To** dates and press **Apply**. The whole screen updates to that period.

3 The switches

“Include bots” and “Preview layout” are for the team — **you can ignore both.** Leave them off.

4 The little source tags

Labels like “GA4 live” or “Clarity live” just say **where a number came from and that it’s fresh**. You don’t need to know those tools — the tag is a freshness stamp.

Good to know: a green “**4/4 live**” at the top means all data sources are current. And a dash “—” anywhere means “no data yet,” **never** a zero — the dashboard never guesses or makes numbers up.

2 • THE FIVE TABS — WHAT EACH ONE IS FOR

B

Board

“How is the business doing?”

The money view for leadership — how much is in the sales pipeline, how much revenue has been won, and what's blocking marketing from getting credit for deals.

I

Insights

“What do the website numbers mean?”

The plain-English summary of the website — is traffic growing, how does it compare to the industry, and what's driving results. Start here if you want the story, not the detail.

W

Website

“Who's visiting and what do they do?”

The detailed website view — how many people visit, where they come from, which pages they land on, and whether those pages hold their attention.

Bl

Blog

“Which articles are landing?”

A ranked list of blog posts by how much traffic they draw — so you can see which topics resonate and which don't. Every post is clickable.

Li

LinkedIn

“Is our brand growing?”

How HDI's LinkedIn page is performing — followers over time, how posts perform, and which kinds of posts get the most engagement.

There's also a **Benchmarks** tab (the industry standards the team compares against) — useful, but not one of the five you'll live in day-to-day.

↑ +48% A **green up-arrow** = better than the period before. This is good.

↓ -12% A **red down-arrow** = worse than the period before. Worth a look.

bar A **lime bar** = it clears the industry benchmark (a good result).

bar A **lighter bar** = below the benchmark. Context, not alarm.

— A **dash** = no data yet. Never a zero. Nothing is invented.

was 32% “**was ...**” = the value in the previous period, so you can see the change.

“**vs prior period**” means the dashboard compares your chosen window to the one right before it — e.g. the last 30 days against the 30 days before that. Same length, fair comparison. “**Reference**” next to a benchmark means it's an industry figure shown for context, not yet an official HDI goal.

4 · WORDS YOU’LL SEE, IN PLAIN ENGLISH

Visitor — one person who came to the website.

Impression — one time a post was shown to someone (LinkedIn).

Channel — how someone arrived: a Google search, a direct visit, a social link, etc.

Bot — automated (non-human) web traffic. About half of all web traffic is bots — normal, and filtered out where it matters.

Closed won — deals that were signed and became revenue.

Benchmark — the typical industry number, shown so you know if HDI is ahead or behind.

Session — one visit. One person can visit several times.

Engagement rate — the share of visits/posts where people actually did something (read, clicked, reacted) — a quality score.

Landing page — the first page someone lands on when they arrive.

Pipeline — the total value of sales deals currently in progress.

Followers — people who subscribed to HDI's LinkedIn page.

GA4 / Clarity — the two behind-the-scenes tools that measure the website. You never open them — the dashboard reads them for you.

5 · TRY IT – YOUR FIRST 60 SECONDS

- 1 Open the dashboard link. You'll land on the **Board** tab.
- 2 At the top, click **30D** to look at the last 30 days.
- 3 Click the **Website** tab. Read the top numbers — visitors, sessions — and their green/red arrows.
- 4 Scroll to **Landing pages** and **Top pages**. Click any page name to open the real page.
- 5 Click the **LinkedIn** tab and look at the **Followers over time** line — is it climbing?
- 6 That's it. Nothing you click changes any data — explore freely.

The one promise behind every number: everything you see is read live from HDI's real systems and stamped with where it came from. Nothing is estimated, rounded up, or filled in — if a number isn't known yet, it shows a dash. You can trust what's on the screen.
